Lab 1: Text Editors and Using the Debugger

Changes I made:

I changed a line in lookup.c on line 450, adding an if statement that breaks if dp is null, to prevent the segfault, where the line "sp = dp->word;" potentially dereferences a null pointer

The most helpful debugger command was backtrace because it let me see where the problem was, after that the most helpful command was p, because printing the values helped me understand what was going on
